                                                                                                                                                                                                                                                                                     RESULT 4
                                                                                                                                                                                                                                                                                                                                                                      The invention describes a menhod compirang on expression profile of the at least one gene in a peripheral blood sample of a patient to at least one gene in a peripheral blood sample of the at least one gene, where the patient has a solid tumour, and each of the gene is differentially expressed in peripheral blood monuclear cells (FBMCs) of a first class of patients as compared to PBMCs of a second class of patients, where both the first and second classes is a subcluster formed by an unsupervised clustering analysis of gene expression profile in PBMCs of a population of patients who have the solid tumour, and where the majority of the first class of patients has a first clinical outcome, the majority of the first class of patients has a second clinical outcome. Also described are: a speciment and expression profile of a patient one gene in a peripheral blood sample of a patient where the cutomout. (ii) at least another storage medium including data that represent an expression profile of a cutomout. (iii) at least another storage modium including data that represent at least one reference expression profile of the gene, (iii) a program, where expression levels of the gene in peripheral blood sample of executing the program, where expression levels of the gene in peripheral blood cutomodear calls of patients who have the solid tumour forting data for solid tumour prognosis genes, where can fine a solid tumour prognosis genes is differentially expressed in peripheral blood comprising concentrated probes for solid tumour prognosis genes, where peach of the patients as compared to pBMCs of a second class of patients as econd classes of the invention. Note: The sequence data for this assert data for minical cutomory and where the f
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A method, useful for prognosing and treating solid tumor, comprises comparing an expression profile of a gene expressed in peripheral blood mononuclear cells to a reference expression profile of a gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 invention describes a method comprising comparing an expression

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits in creased or decreased expression in lung cancer samples. Lung cancer associated polypoptide, for compound that modulates a lung cancer-associated polypoptide, for inhibiting proliferation of a lung cancer-associated polypoptide, for cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful contracting lung cancer, such as small cell lung cancer, non-small cell lung cancer or other benign or precancerous lessions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary disease, fibrosis, bronchites in the genes, polynucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. ```

```
Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of detecting an ovarian cancerassociated transcript in a cell from a patient, by contacting a blological sample from the patient with a polymucleotide that selectively hybridizes to a sequence at least 80% identical to any of one of 80 nucleic acid sequences given in the specification. The method is useful in diagnosing ovarian cancer and in identifying and using agents and/or targets that inhibit ovarian cancer. The nucleic acid molecule, polypeptide and the antibody may also be used in detecting ovarian cancers, monitoring and early detection of relapse following treatment,
ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the

The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
whose expression is upregulated or downregulated in specific cancers or
other diseases such as angiogenic or fibrotic disorders, and to methods
of determining the presence or absence of a pathological cell in a
patient by detecting a nucleic acid at least 80% identical to those of
the invention or by detecting a polypeptide of the invention. The
invention also relates to expression vectors and host cells comprising a
nucleic acid of the invention; antibodies and host cells comprising a
polypeptide of the invention; use of such antibodies for drug targeting;
and methods of screening for modularors of activity or expression of the
polypeptides and mucleic acids. The nucleic acids, polypeptides,
antibodies and methods are useful for diagnosing, prognosing and treating
cancer and other conditions such as psoriasis, ischaemia, heart disease,
atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
neovascularistation syndromes, scarring and uterine fibroids. They may
also be useful in wound healing and in contraception. The
                           Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ů,

The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, anti-HIV; cytostatic; antidiabetic; antiasthmatic; cachexia; AIDS; antinflammatory; cardiant; haemostatic; neuroprotective; anorectic; nootropic; immunosupressive; osteopathic; antiparkinsonian; cancer; antinfertility; cerebroprotective; gene therapy; NOVX; NOV; fertility; metabolic disorder; diabetes; obesity; infectious disease; anorexia; neurodegenerative disease; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoletic disorder; cardiovascular disorder; bronchial asthma; dyslipidemia; metabolic disturbance; neurogenesis; metabolic syndrome X; wasting disorder; cell differentiation; gene; cell proliferation; haematopolesis; wound healing; anglogenesis; ds.
              Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.

Claim 16; Page 114-115; 619pp; English.

```
The present invention relates to new isolated proteins (NOVX) and their coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is any number from 1 to 48. The NOVX proteins and coding sequences are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX associated disorder. The NOVX calong sequences and proteins are useful for treating, preventing or diagnosing diseases, anorexia, cancer associated disorder, neurodegenerative disease, Alzheimer's disease, diabetes, cancer, neurodegenerative disease, anorexia, cancer associated cachexia, cancer, neurodegenerative disease, Alzheimer's disease, parkinson's disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic disorders associated with obesity, metabolic syndrome X or wasting disorders associated with chronic disease or various cancers. The NOVX coding sequences and proteins may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antipolesis that bind immunospecifically to NOVX substances for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    therapeutic or diagnostic methods

Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.

Example 2; Page 78; 79pp; English

```
The present sequence encodes the human 5T4 tumour-associated antigen carcinomas but has a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour induced were inoculated with a virus expression vector containing the present sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-blased activity, where a difference between the test agent-blased activity and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying a candidate p53 pathway-modulating agent for treating cancer

expressed in MYCN activated cells. Specifically, it refers to polymucleotide sequences that exhibit differential expression patterns in cells activated by the transactivator MYCN, where MYCN is a proto-oncogene that is amplified in neuroblastoma cells and is common in small cell lung cancers. The present invention describes these cDNA molecules as useful for in hybridisation assays to detect expression of mucheic acids (or complementary nucleic acids) in a present in a given sample, as well as for screening assays by identifying molecules or compounds that specifically bind the CDNA as a ligand and modulate function or activity. Accordingly, these compositions exhibit cytostatic activity and can also be used for gene therapy purposes. This polymucleotide sequence is a cDNA that is differentially expressed in MYCN activated cells, given in an
for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS related DNA

```
Detecting a bladder cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a bladder cancer-associated polynucleotide or antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method for detecting a bladder cancerassociated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with a polynucleoride that selectively hybridises to a sequence that is 80 % identical to a table of sequences (see ACCSO951 to ACC51059). ACC50951 to ACC51059 encode the human bladder cancer-associated proteins given in ABR40146 to ABR40421). Bladder cancer-associated proteins given in ABR40146 to have cytostatic activities, and can be used in antisense gene therapy and in vaccine production. The method can be used for detecting a bladder cancer-associated transcript in a cell from a patient. The method is useful in diagnosing or treating bladder cancer and in screening for compounds that modulate bladder cancer, such as hormones or antibodies. The nucleic acid molecules from the present invention may be used in
exemplification of the invention. NOTE: This sequence does not appear in the printed specification but has been obtained in electronic format from the US Patent Office at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; bladder cancer; cytostatic; gene therapy; vaccine; gene; ss.

transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 * identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer associated polynucleotides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by

administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell lung cancer or other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polynucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent blissed activity, and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Description

The invention relates to a method of inhibiting a cancerous phenotype of a cell comprises contacting a cancerous mammalian cell with an agent for inhibition of DKF2p56G1133 activity. The methods are useful for treating cancer, e.g. breast cancer. This sequence represents a gene product which is differentially expressed in breast cancer cells. The sequence can be used in the method of the invention.
                                                               Inhibiting a cancerous phenotype of a cell, useful for treating breast sancer comprises contacting a cancerous mammalian cell with an agent for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Open reading frame detection; genome sequencing; colon cancer; breast cancer; population genome analysis; genetic shift; cancer; antibiotic resistance; antibiotic non-tolerance; congenital disease; agriculture; food crop genome; resistance gene; retrovirus; influenza virus; eukaryotic pathogen detection; trypanosome; Plasmodium;

The invention describes a method of determining open reading frames in the genome of organism, comprising contacting mRNA from cell of organism with a single oligonucleotide primer (1) at low stringency, preparing single oligonucleotide primer (1) at low stringency, preparing condamness and sequencing the product, and repeating the contacting, preparing conditions and amplifying steps with different primers and sequencing resulting conditions are sequenced from a genome of an organism corresponds to a nucleotide sequence from a genome of an organism corresponds to a nucleotide sequence from a genome of an organism; and for sequencing concluded to the part of a genome of an organism; and for sequencing and or human cell which is associated with a pathological condition e.g. a nucleotide sequence of an organism. mNAM is obtained from mammalian concludes or sequence of an organism. mNAM is obtained from mammalian concludes or sequence of an organism. mNAM is obtained from mammalian concludes or mmall populations. further, it can be used to carry out genetic analyses of parge or small populations. further, it can be used to study living an individual or population more or less likely to be afflicted with an individual or population more or less likely to be afflicted with an individual or population more or less likely to be afflicted with as scorer, and so forth. The method can also be used in the study of the study of whether the conditions are likely to be passed to offspring through over or sperm. The analyses for pathological conditions can be carried out in all animals, plants, birds, fish, etc. Using this method, in the area of agriculture, for example the genomes of food crops can be studied in this way. Similarly, the method permits determination of the pathogens which integrate into the genome, such as criviliance and also applied to eukaryotic pathogens, such as a trypanosomes different approaches to cundersone shiftes or mutations, which may require different approaches to polymucleotide isolated from h

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain caction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed (II) are useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in rissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). In are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in the polypeptide and polynucleotide sequences have applications in the polypeptide and polynucleotides of other traits to assess by brodiversity and the polypeptide and polypeptides or other traits to assess to be application of mutations and polymerations of the polypeptide and polypeptides or other traits to assess to be application of mutations and polymerations of the polypeptide and polymerations of the polyperation of the polyperation of the polyperat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and to produce other types of data and products dependent on DNA and amino acid sequences. A method, useful for prognosing and treating solid tumor, comprises comparing an expression profile of a gene expressed in peripheral blood mononuclear cells to a reference expression profile of a gene.

Disclosure; Page; 111pp; English

The invention describes a method comprising comparing an expression profile of at least one gene in a peripheral blood sample of a patient to at least one reference expression profile of the at least one gene, where the patient has a solid tumour, and each of the at least one gene, where the patient has a solid tumour, and each of the first and second classes of patients have the solid tumour, and coth the first and second classes of patients have the solid tumour, and appulation of patients who have the solid tumour, and appulation of patients who have the solid tumour, and where the majority of the first class of patients has a first clinical outcome. Also described are: a system comprising (i) a memory or a storage medium including data that represent an expression profile of at class to one paper in a peripheral blood sample of a patient who has a solid tumour, (ii) at least another storage medium including data that represent at least one reference expression profile to the reference expression profile, and (iv) a processor capable of executing the program capable of comparing the expression profile to the reference expression profile, and (iv) a processor capable of executing the comprising concentrated probes for solid tumour prognosis genes, where each of the patients who have the solid tumour prognosis genes is differentially expressed in PBMCs of a first class of patients has a second classe of patients has a second class of patients has a second class of controme. The method, system, and array are useful for prognosis gene of the method, system, and array are useful for prognosis gene of the burnant prognosis genes and intention of parming the reference and tumour prognosis genes and patients has a solid tumour prognosis gene of the prainted proper expression between the patients has a second classe of patients and second classes of patients has a second clas in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences specification, but was obtained of the printed

The present sequence encodes the canine 5T4 tumour-associated antigen (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour idagnosis, targeting and immunotherapy. Mice in which tumours had been human or murine 5T4 gene sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen can be used to elicit an immune response, preferably CTL or an antibody response in a
                                                                                                                                                                                                                                                            Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           dene sednence;

The invention comprises a method of detecting a breast cancer-associated transcript in a cell from a patient. The method of the invention involves contacting a biological sample from the patient with a nucleotide that hybridises to one of the 69 breast cancer-associated gene sequences shown in the specification. The method of the invention is useful in the diagnosis or prognosis of breast cancer. And for detecting genes that are up or down-regulated in breast cancer calls. Genes identified by the method of the invention can be used in diagnostic purposes and also as targets for screening for therapeutic compounds that modulate breast cancer (e.g. hormones or antibodies). Identification of genes that are over or under expressed in breast cancer can additionally provide high-resolution, high-sensitivity datesets which can be used in the areas of diagnostics, therapeutics, drug development, pharmacogenetics, protein structure and biosensor development. Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased expression in lung cancer.

Claim 22; Page 336; 453pp; English

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer associated polymucleotides and polymeptides are used for identifying a compound that modulates a lung cancer-associated polymeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell lung cancer or other benign or precancerous lesions, e.g. atlectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary disease, fibrosis, bronchhectasis. The genes, polymucleotides and polypeptides are useful compounds that modulate lung cancer, such as antibodies. Sequences and as targets for screening for therapeutic compounds that modulate lung cancer-associated polymucleotides of the nvention

Homo sapiens

```
The invention relates to a method of detecting an ovarian cancerassociated transcript in a cell from a patient, by contacting a biological sample from the patient with a polynucleotide that selectively hybridizes to a sequence at least 80% identical to any of one of 80 mucleic acid sequences given in the specification. The method is useful in diagnosing ovarian cancer and in identifying and using agents and/or targets that inhibit ovarian cancer. The nucleic acid molecule, polypeptide and the antibody may also be used in detecting ovarian cancers, monitoring and early detection of relapse following treatment, monitoring response to therapy, selecting patients for post-operative chemotherapy or radiation therapy, in selecting mode of therapy, and determining tumour prognosis, early detection of pre-cancerous lesions, and as vaccines. This sequence corresponds to one of the nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; differential expression; cancer; angiogenic disorder;

```
The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
whose expression is upregulated or downregulated in specific cancers or
other diseases such as angiogenic or fibrotic disorders, and to methods
of determining the presence or absence of a pathological cell in a
patient by detecting a nucleic acid at least 80% identical to those of
the invention or by detecting a polypeptide of the invention. The
invention also relates to expression vectors and host cells comprising
nucleic acid of the invention; antibodies which specifically bind a
polypeptide of the invention; use of such antibodies for drug targeting;
polypeptides and nucleic acids. The nucleic acids, polypeptides,
antibodies and methods are useful for diagnosing, prognosing and treating
antibodies and chods are useful for diagnosing, prognosing and treating
cancer and other conditions such as psoriasis, ischaemia, heart disease,
atherosclerosis, inflammatory diseases, and uterrine fibroids. They may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
        retinal neovascularistaion syndrome; scarring; uterine fibroid; detection; diagnosis; prognosis; drug screening; drug targeting; wound healing; contraception; cytostatic; cardiant; immunomodulatory; vulnerary; gene therapy; vaccine; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      also be useful in wound healing and in contraception.                                        The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway modulating agent for preparing a for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.
                                                                                                                                                                                                                                     Human; p53 pathway; Leucine rich repeat capricious related protein;

The present invention relates to new isolated proteins (NOVX) and their coding sequences (ABV99127-ABV99595 and ABP70049-ABP70149), where X is any unuber from 1 to 48. The NOVX proteins and coding sequences are useful in the manufacture of medicament for treating a syndrome associated with a human disease, medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX coding sequences and proteins are useful for treating. The NOVX coding sequences and proteins are useful for treating. Cancer, neurodegenerative disease, anorex-associated cacheria, cancer, neurodegenerative disease, Alzheimer's disease, Parkinson's disease, immune disorders, haematopoietic disorders, cardiovascular disorders, fartility, bronchial aschma, AIDS, dyslipidemia, metabolic disorders, fartility, bronchial aschma, AIDS, dyslipidemia, metabolic disorders associated with obesity, metabolic syndrome X or wasting disorders associated with obesity, also no various cancers. The NOVX coding sequences and proteins may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell profileration, haematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods
                                                                                                                                                                                                                                                                                                                                                                                                                                       11 L, Mezes PD, Smithson G, Guo X, Gerlach V, Casman SJ;

The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the proposition-rich glycoproteins known as 574, and the confootal leucine-rich glycoproteins the styressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell proliferation, infections, and inflammatory conditions in animals, preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also be used in diagnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, urine, tissues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating foetal cells from maternal blood. The protein are useful for isolating foetal cells from maternal blood. The cells may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus(es). The present sequence encodes feline 574 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel canine or feline 5T4 polypeptide and polynucleotides encoding the polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat.
                                                                                                                                                                                                            Feline; cat; oncofoetal leucine-rich glycoprotein; 5T4; tumour; cell proliferative disorder; infection; inflammatory condition; cancer immunotherapy; foetal cell; maternal blood; cytostatic; foetal abnormality; foetal sex determination; gene; ss.

The invention relates to a novel Major Histocompatibility Complex (WHC) class I peptide epitope of the 5T4 antigen. The invention further class I peptide epitope of the 5T4 antigen. The invention further provides a polyepitope string comprising the 5T4 epitope erring of the 5T4 epitope; a vector system capable of delivering the 5T4 epitope mucleic acid to a cell; a cell pulsed with the 5T4 epitope, a polyepitope of the 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine comprising the above; a method for treating and/or preventing a disease in a subject by administering the vaccine; an agent capable of binding specifically to the 5T4 epitope and/its encoding nucleic acid; a method comprising detecting the presence of the 5T4 epitope or its encoding nucleic acid in a subject; and a T cell line or clone capable of mucleic acid in a subject; and a T cell line or clone capable of mucleic acid in a subject; and a T cell line or clone capable of mucleic acid in a subject; and a T cell line or clone capable of mucleic acid in a subject; and a call into or clone capable of mucleic acid in a subject; and a cell into acid and the vector system or cell is useful in the prevention and/or treatment of a disease, particularly cancer. The detection method is useful for diagnosing or monitoring the progression of a cancerous disease, and for detecting the presence of the 5T4 epitope or its nucleic acid. The T cell line or clone is useful in the manufacture of a medicament for treating and/or preventing a disease. This polynucleotide sequence represents the feline or preventing a disease. This polynucleotide sequence represents the feline or string a disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New major histocompatibility complex class I peptide epitopes from human 5T4 tumor-associated antigen, useful for preventing and/or treating a

The invention relates to a Major Histocompatibility Complex (MHC) class II peptide epitope of the 5T4 antigen. The vaccine or T-cell line or clone has a cytostatic activity, as it is useful in manufacturing a medicament for preventing and/or treating a disease, particularly cancer. The methods are useful for detecting T-cells capable of specifically recognising a peptide epitope in conjunction with an MHC molecule, for diagnosing or monitoring the progression of a cancerous disease, or for detecting the presence of a peptide or nucleic acid using an agent. The MHC class II peptide epitope of the invention can be used in gene therapy or as part of a vaccine. This polynucleotide sequence represents the DNA
                                                                                                                                                                                                                                                                                                                                  gene; ds; feline; Major Histocompatibility Complex class II; MHC; epitope; 5T4 antigen; vaccine; T-cell; cytostatic; cancer; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New Major Histocompatibility Complex class II peptide epitope of 5T4, useful for manufacturing a medicament for diagnosing, preventing and/or treating a disease, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 1260 BP; 221 A; 451 C; 346 G; 241 T; 0 U; 1 Other;

The present sequence encodes the human ST4 tumour-associated antigen carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. ST4 antigen may therefore be useful in tumour idagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inoculated with a virus expression vector containing the present sequence. The ST4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen test can be used to elicit an immune response, preferably CTL or an antibody response in a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tumor associated antigen, 5T4 capable of eliciting cytotoxic T\text{-lymphocyte} response useful in vaccinating against and in treating tumors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a method comprising comparing an expression profile of at least one gene in a peripheral blood sample of a patient to at least one reference expression profile of the at least one gene, where the patient has a solid tumour, and each of the gene is differentially
                                                                                               The invention relates to a method of inhibiting a cancerous phenotype of a cell comprises contacting a cancerous mammalian cell with an agent for inhibition of DKF2566I133 activity. The methods are useful for treating cancer. e.g. breast cancer. This sequence represents a gene product which is differentially expressed in breast cancer cells. The sequence can be used in the method of the invention.
                      Inhibiting a cancerous phenotype of a cell, useful for treating breast cancer comprises contacting a cancerous mammalian cell with an agent for inhibition of DKFZp5661133 activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method, useful for prognosing and treating solid tumor, comprises comparing an expression profile of a gene expressed in peripheral blood mononuclear cells to a reference expression profile of a gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Burczynski ME, Twine NC, Slonim DK;

unsupervised clustering analysis of gene expression profiles in PBMCs of a population of patients who have the solid tumour, and where the apopulation of patients who have the solid tumour, and where the cap oppulation of patients who have the solid tumour, and where the majority of the first class of patients has a first clinical outcome, and the second class of patients has a second clinical outcome. Also described are: a system comprising (i) a memory or a cutome including data that represent an expression profile of a patient who has a solid tumour, (ii) at least another storage medium including data that comparing the expression profile of the gene, (iii) a program capable of comparing the expression profile to the reference expression profile, and (iv) a processor capable of executing the capression profile, and (iv) a processor capable of executing the expression profile, and (iv) a processor capable of executing the capression profile, and (iv) a processor capable of executing the capression profile, and (iv) a processor capable of executing the capression profile outcomes of the patients who have the solid tumour correlate with clinical outcomes of the patients so and a nucleic acid or protein array comprising concentrated probes for solid tumour prognosis genes, where each of the patients as compared to PBMCs of a second class of patients as compared to PBMCs of a second class of patients as compared to PBMCs of a second class of patients as compared to PBMCs of a second class of patients as a second class of patients as a second class of patients as a second clumours. This sequence represents a solid tumours. This sequence represents a solid tumours and where the first class of patients as a second class of the inventor, and the second class of patients as a second class of the inventor. The method, system, and array are useful for prognosing and treating cutcome, and the sequence represents a solid tumours. This sequence represents a solid tumours in the proposition, but was obtained in electronic f
expressed in peripheral blood mononuclear cells (PBMCs) of a first class of patients as compared to PBMCs of a second class of patients, where both the first and second classes of patients have the solid tumour, and each of the first and second classes is a subcluster formed by an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /*tag= b

tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inoculated with a virus expression vector containing the human or murine 5T4 gene sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a

Detecting a breast cancer-associated transcript in a patient's cell, useful for diagnosing breast cancer, comprises contacting a biological sample with a polynucleotide that selectively hybridizes with breast cancer nucleic acids. WPI; 2002-583738/62. N-PSDB; ABJ05564.

Claim 9; Page 372; 414pp; English.

The invention comprises a method of detecting a breast cancer-associated transcript in a cell from a patient. The method of the invention involves contacting a biological sample from the patient with a nucleotide that hybridises to one of the 69 breast cancer-associated gene sequences shown

```
in the specification. The method of the invention is useful in the diagnosis or prognosis of breast cancer, and for detecting genes that are up or down-regulated in breast cancer cells. Genes identified by the method of the invention can be used in diagnostic purposes and also as targets for screening for therapeutic compounds that modulate breast cancer (e.g. hormones or antibodies). Identification of genes that are over or under expressed in breast cancer can additionally provide high-resolution, high-sensitivity datasets which can be used in the areas of diagnostics, therapeutics, drug development, pharmacogenetics, protein structure and biosensor development. DNA sequences ABT07693 - ABT07761 represent the 69 breast cancer-associated gene sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Lung cancer-associated polynucleotide, gene, ds, cytostatic, emphysema, antinflammatory; antiasthmatic; non-small cell lung cancer; atelectasis; small cell lung cancer; benign lesion, precancerous lesion; bronchitis; chronic obstructive pulmonary disease, hypersensitivity pneumonitis; interstitial pulmonary fibrosis; fibrosis; asthma; bronchiectasis.

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits in cased or decreased expression in lung cancer samples. Lung cancer compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by cancer in a patient and for treating a mammal having lung cancer by cancer in a patient and for treating a mammal having lung cancer or other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, intersitial pulmonary disease, fibrosis, bronchiectasis. The genes, polynucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences harvest in a patient and cancer, such as antibodies.

The invention relates to a method of detecting an ovarian cancerassociated transcript in a cell from a patient, by contacting a biological sample from the patient with a polynucleotide that selectively hybridizes to a sequence at least 80% identical to any of one of 80 nucleic acid sequences given in the specification. The method is useful in diagnosing ovarian cancer. The nucleic acid molecule, polypeptide and the antibody may also be used in detecting ovarian cancers, monitoring and early detection of relapse following treatment, monitoring response to therapy, selecting patients for post-operative chemotherapy or radiation therapy, in selecting mode of therapy, enhanced the monitoring tumour prognosis, early detection of pre-cancerous lesions, and as vaccines. This sequence corresponds to one of the nucleic acids
                                         Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          fibrotic disorder; psoriasis; ischaemia; heart disease; atherosclerosis; inflammatory disease; autoimmune disease; retinal neovascularistation syndrome; scarring; uterine fibroid; detection; diagnosis; prognosis; drug screening; drug targeting; wound healing; contraception; cytostatic; cardiant; immunomodulatory; vulnerary; gene therapy; vaccine; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cancer/angiogenesis/fibrosis-related nucleic acid, SEQ ID NO:41.

```
The invention relates to nucleic acids and proteins (ADN38683-ADN40064) whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of apthological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention also relates to expression vectors and host cells comprising a nucleic acid of the invention; use of such antibodies for drug targeting, and methods of screening for modulators of activity or expression of the polypeptides and mucleic acids. The nucleic acids, polypeptides, and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            atherosclerosis, inflammatory diseases, autoimmune diseases, retinal meovascularistation syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present sequence represents a nucleic acid sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; p53 pathway; Leucine rich repeat capricious related protein;

                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent acitvity, where a difference between the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, anti-HIV; cytostatic; antidiabetic; antiasthmatic; cachexia; AIDS; antinflammatory; cardiant; haemostatic; neuroprotective; anorectic; nootropic; immunosuppressive; osteopathic; antiparkinsonian; cancer; antinfertility; carebroprotective; gene therapy; NOVX; NOV; Ertility; metabolic disorder; diabetes; obesity; infectious disease; anorexia; neurodegenerative disease; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; cardiovascular disorder; bronchial asthma, dyslipidemia; metabolic disturbance; neurogenesis; metabolic syndrome X; wasting disorder; cell differentiation; gene; cell proliferation; haematopoiesis; wound healing; anglogenesis; ds.

The present invention relates to new isolated proteins (NOVX) and their coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is any unber from 1 to 48. The NOVX proteins and coding sequences are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX coding sequences and proteins are useful for treating.

The NOVX coding sequences and proteins are useful for treating, cancer, neurodegenerative diseases, such as metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer-associated cachexia, cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's disease, immune disorders, haematopoietic disorders, cardiovascular disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic disorders associated with obesity, metabolic syndrome X or wasting disorders and proteins may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, call profileration, haematopoiesis, wound healing and anglogenesis, in gene therapy, in generation of anticonic dispense.

The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the concofoetal leucine-rich glycoproteins known as 574, and the polynucleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell control infections, inflammantory conditions in animals, preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also be used in diagnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extractes of plasma, urine, tissues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating foetal cells from maternal blood. The solation process may form part of a diagnostic method e.g. the foetal cells may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus(es).

The present sequence encodes feline 574 protein
                                                                                                                                                                                                                                                                                                                                                        encoding the
                                                                                                                                                                                                                                                                                                                                                  Novel canine or feline 574 polypeptide and polynucleotides encodir polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 1260 BP; 221 A; 451 C; 346 G; 241 T; 0 U; 1 Other;

DNA encoding feline 5T4 protein.

```
The invention relates to a novel Major Histocompatibility Complex (WHC) class I peptide epitope of the 5T4 antigen. The invention further class I peptide epitope of the 5T4 antigen. The invention further and by provides a polyepitope string of the 5T4 epitope or a polyepitope string of the 5T4 epitope. A vector system capable of delivering the 5T4 epitope nucleic acid to a cell; a cell pulsed with the 5T4 epitope of the 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine comprising the above; a method for treating and/or preventing a disease in a subject by administering the vaccine; an agent capable of binding specifically to the 5T4 epitope and/its encoding nucleic acid; a method comprising detecting the presence of the 5T4 epitope or its encoding nucleic acid in a subject; and a T cell line or clone capable of specifically recognising the 5T4 epitope has cytostatic activity. The vaccine comprising the 5T4 epitope has cytostatic activity. The vaccine comprising the 5T4 epitope or its encoding nucleic acid and the vector system or cell is useful in the prevention and/or treatment of a disease, particularly cancer. The detection method is useful for diagnosing or monitoring the progression of a cancerous disease, and for detecting the presence of the 5T4 epitope or its nucleic acid. The T cell line or clone is useful in the manufacture of a medicament for treating and/or preventing a disease. This polynuclectide sequence represents the feline of 5T4 antigen coding DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                            major histocompatibility complex class I peptide epitopes from human tumor-associated antigen, useful for preventing and/or treating a

The invention relates to a Major Histocompatibility Complex (MHC) class II peptide epitope of the 5T4 antigen. The vaccine or T-cell line or clone has a cytostatic activity, as it is useful in manufacturing a medicament for preventing and/or treating a disease, particularly cancer. The methods are useful for detecting T-cells capable of specifically recognising a peptide epitope in conjunction with an MHC molecule, for diagnosing or monitoring the progression of a cancerous disease, or for detecting the presence of a peptide or nucleic acid using an agent. The MHC class II peptide epitope of the invention can be used in gene therapy coding for the feline 5T4 protein.

manufacture of a medicament for the prevention and treatment of a disease condition. The Scr antibody is useful in the manufacture of a medicament for the prevention and treatment of a disease condition. The Scr antibody is useful in the manufacture of a pharmaceutical composition, for in vivo imaging and/or for adjuvant treatment of a disease. The Scr antibody is also useful for treatment to a disease including antibody is also useful for treatment inflammatory diseases including variable of the script and diseases, cancers, central nervous system diseases, cancers, central nervous system diseases, cardiovascular diseases, periodontal diseases, cardiopulmonary diseases, cardiovascular diseases, and other immune disorders. The present sequence encodes a 574 protein, which is used to produce Scr of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Use of single chain antibody capable of recognizing a disease associated molecule for manufacturing a medicament for preventing and/or treating a disease condition associated with disease associated molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The specification describes the use of a single chain antibody (ScFv),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Canine; dog; oncofoetal leucine-rich glycoprotein; 5T4; tumour; cell proliferative disorder; infection; inflammatory condition; cancer immunotherapy; foetal cell; maternal blood; cytostatic; foetal abnormality; foetal sex determination; gene; 89.

The present sequence encodes the human 5T4 tumour-associated antigen (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour fadagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inculated with a virus expression vector containing the present sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen test can be used to elicit an immune response, preferably CTL or an antibody response in a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                          Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.

concocetal laucine-rich glycoproteins known as 514, and the polymucleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell proliferation, infections, and inflammatory conditions in animals, preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also be used in diagnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, unite, tissues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating foetal cells from maternal blood. The colls may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus (es). The present sequence encodes canine 574 protein
                                                                                                                                                                                                                                                                                                                                                                                                 Novel canine or feline 5T4 polypeptide and polynucleotides encoding the polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   present invention relates to the isolation of canine and feline
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 1263 BP; 200 A; 469 C; 377 G; 217 T; 0 U; 0 Other;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
